

ABSTRACT

There are methods and apparatus, including computer program products, for using incremental generation to develop an application. The incremental generation includes identifying a first main development object. Main development objects related to the first
5 main development objects by an aggregation relationship are identified. Main development objects related to the first main development object by an association relationship are also identified. A determination is made as to whether any identified main development objects have changed. If any identified main development objects have changed, the first main development object is re-generated.
